INTRODUCTION

The *International Code of Zoological Nomenclature* (1985) recommended that institutions publish lists of name-bearing types in their possession. The South African Museum has over 6 000 primary types of insects in its holdings, approximately 50 per cent of which are beetles. The present paper lists the type material of the family Carabidae, including Cicindelinae, and is the first of a series aimed at listing the holdings of Coleoptera types. The list includes 708 type series, 571 (80%) of which were described by L. A. Péringuey, who worked at the South African Museum from 1884 to 1924.

Names listed are those in the original description. Other names are included under comments.

In our collections, a number is allocated to a series—that is, all specimens of a species collected at exactly the same locality, on the same date, by the same collector. A suffix, a–z, is then allocated to individual specimens. Before the re-organization programme of the collections commenced (1993), the prefix SAM-ENT was used. A different system was introduced with re-organization whereby the prefix for the beetles is SAM-COL-A. Catalogue numbers with the prefix SAM-ENT or SAM-COL-A have been attached to all type specimens. For the purposes of computerization, each number comprises six digits, e.g. SAM-ENT000364. However, the initial zeros used to make up the six digits have been omitted to keep this list as short as possible.

Collection details, as specified on the label, have been placed in quotes. If there are no details at all on the specimen, this fact is indicated under comments that are placed in square brackets.

The type status is stated in lowercase if taken directly from the label on the specimen and in uppercase if it was interpreted. The name of the collector is given within brackets in italics.

Péringuey's type material poses some problems. Many of his specimens are labelled 'type' or 'typ'. Where only one such specimen is labelled and where the description suggests only one specimen (i.e. definite dimensions are cited and not a range), it is considered to be the holotype. However, where a specimen is

Ann. S. Afr. Mus. **104** (9), 1995: 249–309.

assumed to be a holotype but other material may exist—unbeknown to us—in other collections, this may alter the status of the specimen in question. Where more than one specimen is labelled 'type' and where the description suggests more than one specimen, or where there is only one specimen labelled but the description suggests more than one, they are considered to be the syntypes. However, this is occasionally contradicted, as Péringuey sometimes suggested only one specimen, by citing a fixed dimension, in the description but then labelled more than one specimen 'type'. Discrepancies such as this are mentioned in square brackets.

There are many inconsistencies with the re-designation of Péringuey types. In some cases, where the status of lectotype and paralectotype should have been applied, the terms holotype and paratype were applied. In these instances, the status has been corrected and printed in uppercase and further comments included to help establish the true status. It has been assumed that the re-designations have been published.

In some cases, Péringuey designated only one of a series as 'type' and specialists examining the material later have designated the type specimen as holotype and other specimens in the series as paratypes. Where undesignated material of the type series in the collection exists, the details have been included under comments. Furthermore, where no designated material exists but there is material that could be type material, it has also been included.

In the collection there are specimens of which the status is uncertain, which Péringuey had labelled either 'type' or 'in litt': these specimens include the species *Abacetus capensis*, *Apotomus australis*, *Brachinus nodieri*, *Chlaenius jansei*, *Metaxymorphus umbraculatus*, *Systolocranius similans*, *Teratotarsa barnardi* and *Asemobius distinctus*. (*Asemobius* is a genus of the family Staphylinidae but the 'type' in question is a carabid and resembles *Metaxymorphus robustus* Péringuey.) These probably have no type status but are mentioned as they might be of some significance.

Some of the specimens bear green holotype and orange paratype labels that were apparently placed on the specimens by Dr A. J. Hesse (S. A. Museum, 1923–1974). These specimens are from Dr Péringuey's private collection and were removed by Dr Hesse, as they were considered to be the property of the South African Museum. These designations by Dr Hesse have never been published and are not considered valid, but are mentioned as they may be of some historical significance. It is possible that some type material from Péringuey's private collection still exists in other institutions.
